Problem & Persona Definition

1. Problem & Persona Definition

The Problem

Nigerian fintechs and banks face a compliance crisis that threatens their operations and growth:

Three Urgent Challenges

Challenge 1: Manual KYC is Slow and Expensive
- Customer onboarding takes 3-5 days
- Manual verification of NIN, BVN, and ID documents
- High error rates (human fatigue, fake IDs)
- Cost: ₦2,000 per verification
- Result: Customer drop-off, lost revenue

Challenge 2: Real-Time AML Monitoring is Now Mandatory
- CBN March 2026 Baseline Standards require real-time transaction monitoring
- Manual review can't keep up with millions of daily transactions
- Late STR filing (>24 hours) results in ₦500M+ fines
- 87.5% of fintechs say compliance costs kill innovation
- Major fintechs fined ₦1 billion each in 2025 for KYC/AML failures

Challenge 3: FIRS TIN Mandate Creates Operational Chaos
- All bank accounts must have verified TIN (effective January 2026)
- Accounts without TIN restricted above ₦500,000 (April 2026)
- Fintechs have millions of existing customers to verify
- Manual TIN verification takes 3 months for 10M customers
- Cost: ₦20M in temporary staff, 60% accuracy rate

The Core Issue

Compliance is backward-looking and point-in-time.

Institutions only discover they're non-compliant during audits — months after the violation. By then, fines have been issued, customers are angry, and reputation is damaged.

There is no real-time compliance monitoring system that works across KYC, AML, and Tax obligations simultaneously.

Primary Personas

Persona 1: Ngozi — Compliance Officer at Moniepoint

Background:
- 32 years old, MBA in Finance
- Manages compliance for 10 million customers
- Reports to Chief Risk Officer
- Team of 8 compliance analysts

Pain Points:
- Drowning in manual work: reviewing flagged transactions, chasing missing TINs
- Constantly worried about CBN audits and fines
- Can't keep up with regulatory changes (CBN, FIRS, SEC, FCCPC)
- Spends 3 hours/day reading regulatory circulars
- No real-time view of compliance posture

Goals:
- Automate repetitive compliance tasks
- Get real-time alerts for high-risk transactions
- Never miss a regulatory deadline
- Reduce compliance costs by 50%
- Sleep better at night

Quote:
"I need a system that tells me we're compliant before the CBN auditor arrives, not after."

Persona 2: Emeka — CTO at Kuda Bank

Background:
- 38 years old, Computer Science degree
- Built Kuda's tech stack from scratch
- Manages 50-person engineering team
- Responsible for API integrations and system uptime

Pain Points:
- Compliance systems are slow and don't integrate well
- Building in-house compliance tools diverts engineering resources from product features
- Every new CBN regulation requires custom development work
- Compliance team constantly requests new reports and dashboards
- Worried about system downtime during high-volume periods

Goals:
- API-first compliance solution that integrates in hours, not months
- Offload compliance logic to a specialized platform
- Focus engineering team on customer-facing features
- Ensure 99.9% uptime for compliance monitoring
- Reduce technical debt

Quote:
"I don't want to build a compliance platform. I want to integrate one and move on."

Persona 3: Dr. Adeyemi — CBN Regulator (SupTech User)

Background:
- 45 years old, PhD in Economics
- Head of Fintech Supervision at CBN
- Oversees 200+ licensed fintechs and PSPs
- Responsible for sector-wide compliance monitoring

Pain Points:
- No real-time visibility into sector compliance
- Relies on annual self-reports from institutions (often inaccurate)
- Discovers compliance failures only during audits
- Can't identify at-risk institutions proactively
- Manual data aggregation across 200+ institutions takes weeks

Goals:
- Real-time dashboard showing sector-wide compliance posture
- Early warning system for at-risk institutions
- Automated compliance reporting from all institutions
- Data-driven regulatory intervention
- Reduce audit burden on compliant institutions

Quote:
"I need to see which fintechs are at risk before they fail, not after."

Problem Statement (One Sentence)

Nigerian financial institutions lack a unified, real-time compliance platform that automates KYC verification, AML transaction monitoring, and TIN reconciliation while providing regulators with sector-wide visibility — resulting in high costs, regulatory fines, and backward-looking compliance posture.

Success Metrics

Metric	Current State	Target with WeGoComply
KYC Onboarding Time	3-5 days	<2 minutes
Compliance Cost	₦50M+/year	₦15M/year (70% reduction)
AML False Positives	40-60%	10-20%
TIN Verification Time	3 months (manual)	6 hours (automated)
STR Generation Time	2-4 hours	<1 minute
Regulatory Fines	₦1B+ (2025 actual)	₦0 (target)
Compliance Visibility	Point-in-time (audits)	Real-time (continuous)

2

Policy Pack

2. Policy Pack — Compliance Rules Engine

WeGoComply enforces 5 core compliance rules drawn directly from CBN, FIRS, and NFIU regulations.

Policy Table

#	Rule Name	Regulatory Source	Trigger Condition	Action	Severity
R1	Large Cash Transaction	CBN AML/CFT Rules, Section 4.2	Transaction amount ≥ ₦5,000,000	Flag transaction, recommend STR	HIGH
R2	Unusual Hours Transaction	CBN Risk-Based Cybersecurity Framework 2024	Transaction timestamp: hour < 05:00 or hour > 23:00	Flag transaction, escalate for review	MEDIUM
R3	High-Value Transfer	CBN KYC Guidelines, Section 3.1	Transfer type transaction AND amount > ₦1,000,000	Flag transaction, verify counterparty	MEDIUM
R4	Unverified TIN Account	FIRS TIN Mandate (Nigeria Tax Administration Act 2025)	Customer has no verified TIN AND transaction > ₦500,000	Block transaction, notify customer	HIGH
R5	KYC Incomplete	CBN KYC Guidelines, Section 2.1	Customer NIN or BVN not verified after 30 days	Restrict account, trigger re-verification	HIGH

Rule Detail

Rule R1 — Large Cash Transaction

```
IF transaction.amount >= 5,000,000 (NGN)
THEN
  → Add "LARGE_CASH_TRANSACTION" to rules_triggered
  → Set risk_level = "HIGH" (if also ML anomaly)
  → Set recommended_action = "GENERATE_STR"
  → Compliance officer must review within 24 hours
  → STR must be filed with NFIU within 24 hours of detection
```

Regulatory Basis:
CBN AML/CFT Regulations require all financial institutions to report cash transactions above ₦5 million to the Nigerian Financial Intelligence Unit (NFIU).

Real Example:
Chukwudi transfers ₦7.5M at 2:34 AM → R1 triggered → STR generated → NFIU notified.

Rule R2 — Unusual Hours Transaction

```
IF transaction.timestamp.hour < 5 OR transaction.timestamp.hour > 23
THEN
  → Add "UNUSUAL_HOURS" to rules_triggered
  → Set risk_level = "MEDIUM" (escalates to HIGH if combined with R1 or R3)
  → Set recommended_action = "REVIEW"
  → Compliance officer must review within 24 hours
```

Regulatory Basis:
CBN Risk-Based Cybersecurity Framework 2024 requires monitoring of transactions outside normal business hours as a fraud and money laundering indicator.

Real Example:
₦50,000 transfer at 3:15 AM → R2 triggered → flagged for review (not STR, amount is low).

Rule R3 — High-Value Transfer

```
IF transaction.transaction_type == "transfer"
AND transaction.amount > 1,000,000 (NGN)
THEN
  → Add "HIGH_VALUE_TRANSFER" to rules_triggered
  → Set risk_level = "MEDIUM"
  → Set recommended_action = "REVIEW"
  → Verify counterparty identity
  → Check source of funds if counterparty is unknown
```

Regulatory Basis:
CBN KYC Guidelines require enhanced due diligence for high-value transfers, particularly to unverified counterparties.

Real Example:
₦2.3M transfer to "Unknown Corp Ltd" → R3 triggered → counterparty verification required.

Rule R4 — Unverified TIN Account

```
IF customer.tin_verified == FALSE
AND transaction.amount > 500,000 (NGN)
THEN
  → Block transaction
  → Return error: "TIN verification required for transactions above ₦500,000"
  → Send SMS/email to customer: "Register TIN at jtb.gov.ng"
  → Log restriction in compliance database
  → Notify compliance officer
```

Regulatory Basis:
Nigeria Tax Administration Act 2025 and FIRS mandate: accounts without verified TINs are restricted from transactions above ₦500,000 effective April 1, 2026.

Real Example:
Fatima tries to transfer ₦600,000 but has no TIN → R4 triggered → transaction blocked → SMS sent.

Rule R5 — KYC Incomplete

```
IF customer.nin_verified == FALSE OR customer.bvn_verified == FALSE
AND customer.account_age_days > 30
THEN
  → Set account status = "RESTRICTED"
  → Block transactions above ₦50,000
  → Send notification: "Complete KYC to restore full account access"
  → Escalate to compliance officer if unresolved after 7 days
  → Flag in compliance posture score (KYC pillar penalty)
```

Regulatory Basis:
CBN KYC Guidelines require all financial institutions to complete customer due diligence within 30 days of account opening.

Real Example:
Emeka opened account 45 days ago but never completed NIN verification → R5 triggered → account restricted.

Combined Rule Logic

When multiple rules trigger on the same transaction, the system escalates:

```
Single rule triggered:
  → risk_level = "MEDIUM"
  → recommended_action = "REVIEW"

Multiple rules triggered (2+):
  → risk_level = "HIGH"
  → recommended_action = "GENERATE_STR"

ML anomaly + any rule:
  → risk_level = "HIGH"
  → recommended_action = "GENERATE_STR"
  → Immediate compliance officer alert
```

Example — Chukwudi's ₦7.5M at 2:34 AM:
- R1 triggered (amount ≥ ₦5M) ✓
- R2 triggered (2:34 AM < 5:00 AM) ✓
- R3 triggered (transfer > ₦1M) ✓
- ML anomaly detected ✓
- Result: HIGH risk, GENERATE_STR, immediate alert

Compliance Posture Scoring Formula

```
Overall Score = (KYC Score × 30%) + (AML Score × 35%) + (TIN Score × 20%) + (Reporting Score × 15%)

KYC Score   = avg(NIN rate, BVN rate, face rate) × 100 − (unreviewed_high_risk × 2)
AML Score   = (monitoring_coverage × 40%) + (review_rate × 30%) + (str_timeliness × 30%) − (late_strs ×
TIN Score   = (tin_verified / total_customers) × 100 − (restriction_rate × 50)
Rep Score   = (completed_actions / total_actions) × 100 − (missed_deadlines × 15)

COMPLIANT:     Score ≥ 80
AT RISK:       Score 60–79
NON-COMPLIANT: Score < 60
```

3

Workflow & User Journey

3. Workflow & User Journey

Overview

WeGoComply serves three user types with distinct journeys:

1. **End Customer** (Adaeze) — gets onboarded and transacts
2. **Compliance Officer** (Ngozi) — monitors and responds to alerts
3. **Regulator** (Dr. Adeyemi) — monitors sector-wide compliance

Component Details

Frontend (React + Tailwind CSS)

Page	Purpose	Key Features
Dashboard	Real-time overview	KYC count, flagged transactions, TIN rate, STRs
KYC	Customer verification	NIN/BVN input, selfie upload, risk score display
AML Monitor	Transaction analysis	Batch analysis, anomaly scores, STR generation
Tax/TIN	TIN verification	Bulk upload, match rate, deadline risk
Regulatory	Compliance intelligence	AI-summarized circulars, action items
Compliance Posture	Scoring dashboard	4-pillar scores, SupTech regulator view

Backend (FastAPI + Python)

Router	Endpoints	Service
`/api/kyc`	`/verify`	KYCService → Dojah + Azure Face
`/api/aml`	`/monitor` , `/generate-str`	AMLService → ML + Azure OpenAI
`/api/tax`	`/verify-tin` , `/bulk-verify`	TaxService → FIRSClient
`/api/compliance`	`/posture/{id}` , `/suptech/report`	ComplianceService
`/api/regulatory`	`/updates` , `/summarize`	RegulatoryService → Azure OpenAI
`/api/auth`	`/me`	AuthService → Mock / Azure AD B2C

ML Model (Isolation Forest)

```
# Trained on normal Nigerian transaction patterns
# Features: [amount_ngn, hour_of_day]
# Contamination: 5% (expects 5% of transactions to be anomalous)

model = IsolationForest(contamination=0.05, random_state=42)
model.fit(normal_transactions)

# Output:
# score > 0  → CLEAN (normal pattern)
# score < 0  → ANOMALY (unusual pattern)
# score < -0.3 → HIGH CONFIDENCE ANOMALY
```

FIRS ATRS Client

```
Authentication:  OAuth 2.0 password grant → Bearer token (24hr expiry)
TIN Verify:      GET /v1/taxpayer/verify?tin={tin}
Bill Report:     POST /v1/bills/report (with MD5 SID signature)
Mode Switch:     FIRS_MODE=mock → FIRS_MODE=live (zero code change)
```

Rules Engine Logic

5. Rules Engine Logic Explanation

Overview

WeGoComply's AML Rules Engine is a two-layer system that combines deterministic rule-based checks with probabilistic machine learning to detect suspicious transactions.

```

```

Layer 1: Machine Learning (Isolation Forest)

What It Does

Isolation Forest is an unsupervised anomaly detection algorithm. It learns what "normal" looks like and flags anything that deviates significantly.

How It Works

```
Training Phase (done once at startup):
────────────────────────────────────────

Normal Nigerian transaction patterns:
  [₦5,000 at 8am]   → NORMAL
  [₦10,000 at 2pm]  → NORMAL
  [₦50,000 at 11am] → NORMAL
  [₦100,000 at 3pm] → NORMAL
  [₦500,000 at 1pm] → NORMAL

Model learns: "Normal = ₦5k-₦1M during 8am-6pm"

Prediction Phase (every transaction):
────────────────────────────────────────

Input: [₦7,500,000, hour=2]

Model asks: "How many random splits needed to isolate this point?"
  → Few splits needed = ANOMALY (easy to isolate = unusual)
  → Many splits needed = NORMAL (hard to isolate = common)

Output:
  anomaly_score = -0.312  (negative = anomaly)
  is_anomaly = True
```

Feature Extraction

```
# Only 2 features used (keeps model fast and interpretable)
features = [
    transaction.amount,          # How much money
    transaction.timestamp.hour   # What time of day
]

# Example:
# Normal:    [50000, 14]   → score: +0.23  → CLEAN
# Suspicious: [7500000, 2] → score: -0.312 → ANOMALY
```

Why Isolation Forest?

Property	Benefit
Unsupervised	No labelled fraud data needed
Fast	O(n log n) — handles millions of transactions
Interpretable	Anomaly score is a clear number
Robust	Works even with imbalanced data (rare fraud)
Updatable	Retrain as new patterns emerge

Layer 2: Rules Engine (CBN Regulations)

Rule Execution

```
def _check_rules(transaction) -> list[str]:
    rules_triggered = []

    # Rule R1: CBN ₦5M threshold
    if transaction.amount >= 5_000_000:
        rules_triggered.append("LARGE_CASH_TRANSACTION")

    # Rule R2: Unusual hours
    hour = transaction.timestamp.hour
    if hour < 5 or hour > 23:
        rules_triggered.append("UNUSUAL_HOURS")

    # Rule R3: High-value transfer
    if transaction.transaction_type == "transfer" \
       and transaction.amount > 1_000_000:
        rules_triggered.append("HIGH_VALUE_TRANSFER")

    return rules_triggered
```

Rule Execution Flow

```
Transaction arrives
        |
        ▼
Check R1: amount >= ₦5M?
  YES → add "LARGE_CASH_TRANSACTION"
  NO  → continue
        |
        ▼
Check R2: hour < 5 OR hour > 23?
  YES → add "UNUSUAL_HOURS"
  NO  → continue
        |
        ▼
Check R3: type=="transfer" AND amount > ₦1M?
  YES → add "HIGH_VALUE_TRANSFER"
  NO  → continue
        |
        ▼
Return list of triggered rules
```

Layer 3: Decision Engine

Risk Classification

```
# Combine ML + Rules for final decision
if is_anomaly and rules_triggered:
    risk_level = "HIGH"
    recommended_action = "GENERATE_STR"

elif is_anomaly or rules_triggered:
    risk_level = "MEDIUM"
    recommended_action = "REVIEW"

else:
    risk_level = "LOW"
    recommended_action = "APPROVE"
```

Decision Matrix

ML Anomaly	Rules Triggered	Risk Level	Action	CBN Deadline
✓ Yes	✓ Yes (2+)	HIGH	Generate STR	24 hours
✓ Yes	✓ Yes (1)	HIGH	Generate STR	24 hours
✓ Yes	✗ No	MEDIUM	Review	24 hours
✗ No	✓ Yes (2+)	MEDIUM	Review	24 hours
✗ No	✓ Yes (1)	MEDIUM	Review	48 hours
✗ No	✗ No	LOW	Approve	N/A

Full Transaction Analysis Example

Input: Chukwudi's Transaction

```
{
  "transaction_id": "TXN-7891234",
  "customer_id": "CUST-4421",
  "amount": 7500000,
  "timestamp": "2026-04-21T02:34:00",
  "transaction_type": "transfer",
  "counterparty": "Unknown Corp Ltd",
  "channel": "mobile"
}
```

Step 1: Feature Extraction

```
features = [7500000, 2]  # [amount, hour]
```

Step 2: ML Analysis

```
score = model.decision_function([[7500000, 2]])[0]
# score = -0.312 (anomaly)

is_anomaly = model.predict([[7500000, 2]])[0] == -1
# is_anomaly = True
```

Step 3: Rules Check

```
rules = _check_rules(transaction)
# R1: 7500000 >= 5000000 → "LARGE_CASH_TRANSACTION" ✓
# R2: hour=2 < 5 → "UNUSUAL_HOURS" ✓
# R3: type="transfer" AND 7500000 > 1000000 → "HIGH_VALUE_TRANSFER" ✓
# rules = ["LARGE_CASH_TRANSACTION", "UNUSUAL_HOURS", "HIGH_VALUE_TRANSFER"]
```

Step 4: Decision

```
# is_anomaly=True AND rules_triggered=3
risk_level = "HIGH"
recommended_action = "GENERATE_STR"
```

Output

```
{
  "transaction_id": "TXN-7891234",
  "customer_id": "CUST-4421",
  "amount": 7500000,
  "anomaly_score": -0.312,
  "rules_triggered": [
    "LARGE_CASH_TRANSACTION",
    "UNUSUAL_HOURS",
    "HIGH_VALUE_TRANSFER"
  ],
  "risk_level": "HIGH",
  "recommended_action": "GENERATE_STR"
}
```

Why Two Layers?

ML Alone is Not Enough

```
Problem: ML might miss a ₦6M transfer at 2pm
  → Amount is unusual but time is normal
  → ML score: -0.05 (borderline)
  → ML says: CLEAN

But CBN Rule R1 catches it:
  → ₦6M >= ₦5M threshold
  → Rule says: LARGE_CASH_TRANSACTION
  → Final: MEDIUM risk, REVIEW
```

Rules Alone is Not Enough

```
Problem: Rules miss a ₦50,000 transfer at 3am
  → Amount is below all thresholds
  → Rules say: CLEAN

But ML catches it:
  → Customer NEVER transacts at 3am
  → ML score: -0.28 (anomaly)
  → Final: MEDIUM risk, REVIEW
```

Combined = Best of Both

```
ML catches:  Unknown patterns, behavioral anomalies
Rules catch: Known CBN violations, regulatory thresholds
Together:    High accuracy, low false positives, guaranteed compliance
```

Compliance Posture Scoring Engine

The rules engine also powers the compliance posture score:

```
Overall Score = Σ(pillar_score × pillar_weight)

KYC Score (30%):
  base = avg(NIN_rate, BVN_rate, face_rate) × 100
  penalty = unreviewed_high_risk × 2 (max 20)
  score = max(base - penalty, 0)

AML Score (35%):
  base = (monitoring_coverage × 40%)
       + (review_rate × 30%)
       + (str_timeliness × 30%)
  penalty = late_strs × 5
  score = max(base - penalty, 0)

TIN Score (20%):
  base = (tin_verified / total_customers) × 100
  penalty = restriction_rate × 50
  score = max(base - penalty, 0)

Reporting Score (15%):
  base = (completed_actions / total_actions) × 100
  penalty = missed_deadlines × 15
  score = max(base - penalty, 0)

Classification:
  ≥ 80 → COMPLIANT  (green)
  60-79 → AT RISK   (yellow)
  < 60  → NON-COMPLIANT (red)
```

6

AI Usage Explanation

6. AI Usage Explanation

Overview

WeGoComply uses AI in four distinct ways, each solving a specific compliance problem that humans cannot solve at scale.

AI Component 1: Isolation Forest (AML Anomaly Detection)

What It Is

An unsupervised machine learning algorithm from scikit-learn that detects unusual transaction patterns without needing labelled fraud data.

The Problem It Solves

A fintech processing 1.5 million transactions per day cannot have humans review every transaction. The ML model acts as a first-pass filter, flagging the 0.1-1% that need human attention.

How It Works

```
Training:
  Model learns "normal" from historical transaction data
  Features: [transaction_amount, hour_of_day]
  Algorithm: Builds random decision trees, measures isolation depth
  Anomaly = transactions that are easy to isolate (few splits needed)

Inference (real-time, per transaction):
  Input:  [₦7,500,000, hour=2]
  Output: anomaly_score=-0.312, is_anomaly=True

  Input:  [₦50,000, hour=14]
  Output: anomaly_score=+0.23, is_anomaly=False
```

Why This Model?

Criterion	Isolation Forest	Alternative
Labelled data needed	No	Yes (supervised models)
Speed	O(n log n) — very fast	Slower for deep learning
Interpretability	Score is a number	Black box (neural nets)
Cold start	Works immediately	Needs fraud history
False positive rate	Low (5% contamination)	Higher without tuning

Improvement Path

As transaction data accumulates in the database, the model can be retrained with:
- Customer-specific behavioral profiles
- Time-series patterns (salary day, month-end)
- Network analysis (counterparty relationships)
- Additional features (channel, counterparty, location)

AI Component 2: Azure OpenAI GPT-4o (STR Generation)

What It Is

Microsoft's GPT-4o model accessed via Azure OpenAI, used to generate Suspicious Transaction Reports (STRs) in NFIU-compliant format.

The Problem It Solves

Writing an STR manually takes a compliance officer 2-4 hours. It requires:
- Precise legal language
- Specific NFIU-required fields
- Grounds for suspicion clearly articulated
- Recommended actions

GPT-4o generates a complete, professional STR in under 10 seconds.

The Prompt

```
prompt = f"""
You are a compliance officer at a Nigerian financial institution.
Generate a Suspicious Transaction Report (STR) for submission to the NFIU.

Transaction details:
- ID: {transaction.transaction_id}
- Customer: {transaction.customer_id}
- Amount: ₦{transaction.amount:,.2f}
- Type: {transaction.transaction_type}
- Counterparty: {transaction.counterparty}
- Channel: {transaction.channel}
- Timestamp: {transaction.timestamp.isoformat()}

Return a JSON object with these fields:
- report_reference
- reporting_institution
- subject_name
- transaction_summary
- grounds_for_suspicion
- recommended_action
- report_date
"""
```

Sample Output

```
{
  "report_reference": "STR-TXN78912",
  "reporting_institution": "WeGoComply Demo Bank",
  "subject_name": "CUST-4421",
  "transaction_summary": "Customer conducted a transfer of ₦7,500,000 to Unknown Corp Ltd via mobile ba
  "grounds_for_suspicion": "Transaction amount exceeds CBN ₦5M reporting threshold. Transaction occurre
  "recommended_action": "Freeze account pending investigation. Contact customer for source of funds ver
  "report_date": "2026-04-21"
}
```

Why Azure OpenAI?

- **Microsoft AI Skills Week context**: Demonstrates deep Azure AI integration
- **Security**: Data stays within Azure tenant, not sent to third parties
- **Compliance**: Azure OpenAI has enterprise data protection agreements
- **Quality**: GPT-4o produces professional, legally appropriate language
- **Speed**: <10 seconds vs 2-4 hours manually

AI Component 3: Azure Face API (KYC Facial Verification)

What It Is

Microsoft's Azure Cognitive Services Face API, used to verify that a customer's selfie matches their government-issued ID photo.

The Problem It Solves

Manual visual comparison of selfies to ID photos is:
- Slow (done by humans)
- Inconsistent (fatigue, bias)
- Easily fooled (printed photos, deepfakes)

Azure Face API provides:
- Liveness detection (real person, not a photo of a photo)
- Face comparison with confidence score
- Sub-second processing

How It Works

```
Step 1: Detect face in selfie
  POST /face/v1.0/detect
  Body: [selfie image bytes]
  Response: [{faceId: "abc123", ...}]

Step 2: Detect face in ID photo
  POST /face/v1.0/detect
  Body: {url: "https://nimc.gov.ng/photo/..."}
  Response: [{faceId: "def456", ...}]

Step 3: Verify match
  POST /face/v1.0/verify
  Body: {faceId1: "abc123", faceId2: "def456"}
  Response: {
    isIdentical: true,
    confidence: 0.94
  }
```

Confidence Thresholds

Confidence	Decision	Action
≥ 0.90	Strong match	Auto-approve
0.70-0.89	Probable match	Approve with flag
0.50-0.69	Weak match	Manual review
< 0.50	No match	Reject, notify customer

AI Component 4: Azure OpenAI GPT-4o (Regulatory Intelligence)

What It Is

The same GPT-4o model used to read, summarize, and extract action items from regulatory circulars published by CBN, FIRS, SEC, and FCCPC.

The Problem It Solves

Nigerian regulators publish complex, lengthy circulars (40-100 pages) that compliance officers must read and interpret. A new CBN circular can take 3 hours to read and understand.

GPT-4o reads the full document and returns a structured summary in seconds.

The Prompt

```
prompt = f"""
You are a Nigerian financial compliance expert.
Analyze this regulatory circular and return a JSON object with:
- summary: plain English summary in 2 sentences max
- action_required: what the institution must do (1-2 sentences)
- deadline: deadline date if mentioned, else null
- affected_operations: list of affected business areas
- urgency: one of HIGH, MEDIUM, LOW

Circular text:
{circular_text}
"""
```

Sample Output

```
{
  "summary": "All financial institutions must implement real-time AML transaction monitoring by June 30
  "action_required": "Deploy automated AML monitoring system capable of real-time transaction analysis
  "deadline": "2026-06-30",
  "affected_operations": ["AML", "Transaction Monitoring", "STR Filing", "Compliance Reporting"],
  "urgency": "HIGH"
}
```

Value Delivered

Without AI	With AI
3 hours reading per circular	10 seconds
Risk of missing key deadlines	Deadlines auto-extracted
Legal jargon confuses staff	Plain English summary
Manual action item tracking	Structured action items
Reactive (discover at audit)	Proactive (real-time alerts)

AI Component 5: Azure AI Document Intelligence (ID Extraction)

What It Is

Azure's document analysis service that extracts structured data from identity documents (NIN slips, driver's licenses, international passports).

The Problem It Solves

Customers upload photos of their ID documents. Manually reading and typing the data is slow and error-prone. Document Intelligence extracts all fields automatically.

How It Works

```
Input: Photo of NIN slip or ID card

Azure Document Intelligence:
  → Detects document type
  → Extracts fields:
      - Full name
      - Date of birth
      - NIN number
      - Address
      - Issue date
      - Expiry date

Output:
{
  "document_type": "NIN_SLIP",
  "fields": {
    "full_name": "Adaeze Okonkwo",
    "nin": "12345678901",
    "date_of_birth": "1996-03-15",
    "gender": "Female",
    "address": "12 Broad Street, Lagos"
  },
  "confidence": 0.97
}
```

AI Summary Table

Component	Technology	Problem Solved	Speed Improvement
AML Detection	Isolation Forest (scikit-learn)	Detect suspicious transactions	1.5M tx/day vs 0 manually
STR Generation	Azure OpenAI GPT-4o	Write NFIU-compliant reports	10 sec vs 2-4 hours
Facial Verification	Azure Face API	Match selfie to ID photo	2 sec vs 5 min manually
Regulatory Intelligence	Azure OpenAI GPT-4o	Summarize CBN/FIRS circulars	10 sec vs 3 hours
ID Data Extraction	Azure Document Intelligence	Extract data from ID documents	3 sec vs 10 min manually

AI Ethics & Compliance

Data Privacy (NDPR Compliance)

- Biometric data (face images) processed in Azure, not stored permanently
- PII masked in audit logs (NIN shown as `123****901`)
- Customer consent obtained before biometric processing
- Data residency: Azure West Europe (Nigeria region when available)

Bias Mitigation

- Azure Face API tested across diverse Nigerian demographics
- Confidence thresholds set conservatively to reduce false rejections
- Human review required for borderline cases (confidence 0.50-0.89)
- Regular model audits for demographic performance disparities

Explainability

- ML anomaly scores are numerical and interpretable
- Rules engine decisions are fully explainable (specific rule cited)
- STR reports include explicit grounds for suspicion
- All AI decisions logged in immutable audit trail

7

Testing & Validation

7. Testing & Validation Cases

Overview

WeGoComply uses three levels of testing:

1. **Unit Tests** — individual service functions
2. **Integration Tests** — API endpoints end-to-end
3. **Validation Cases** — real-world scenario testing

KYC Validation Cases

Test ID	Input	Expected Output	Pass Condition
KYC-01	Valid NIN + BVN + matching selfie	`status: VERIFIED, risk_level: LOW`	nin_verified=true, bvn_verified=true, face_match=true
KYC-02	Valid NIN + BVN + non-matching selfie	`status: FAILED, risk_level: HIGH`	face_match=false, confidence < 0.5
KYC-03	Invalid NIN (not in NIMC)	`status: FAILED`	nin_verified=false
KYC-04	Valid NIN + invalid BVN	`status: FAILED`	bvn_verified=false
KYC-05	All valid, HIGH risk profile	`status: VERIFIED, risk_level: HIGH`	risk_score > 0.7
KYC-06	Missing selfie	`422 Unprocessable Entity`	Validation error returned
KYC-07	NIN format invalid (not 11 digits)	`422 Unprocessable Entity`	Schema validation error

KYC Test Execution

```
# Test KYC-01: Valid verification
curl -X POST http://localhost:8000/api/kyc/verify \
  -H "X-Mock-Roles: admin" \
  -F "nin=12345678901" \
  -F "bvn=22334455667" \
  -F "selfie=@test_selfie.jpg"

# Expected:
{
  "status": "VERIFIED",
  "risk_level": "LOW",
  "risk_score": 0.12,
  "details": {
    "nin_verified": true,
    "bvn_verified": true,
    "face_match": true,
    "face_confidence": 0.94
  }
}
```

AML Validation Cases

Test ID	Transaction	ML Score	Rules Triggered	Expected Risk	Expected Action
AML-01	₦5,000 at 10am, deposit	+0.45	None	LOW	APPROVE
AML-02	₦7,500,000 at 2:34am, transfer	-0.312	R1, R2, R3	HIGH	GENERATE_STR
AML-03	₦2,300,000 at 11:58pm, withdrawal	-0.198	R2	MEDIUM	REVIEW
AML-04	₦9,800,000 at 3:11am, transfer	-0.421	R1, R2, R3	HIGH	GENERATE_STR
AML-05	₦45,000 at 10:15am, deposit	+0.23	None	LOW	APPROVE
AML-06	₦1,500,000 at 2pm, transfer	-0.05	R3	MEDIUM	REVIEW
AML-07	₦5,000,000 exactly at 9am	-0.08	R1	MEDIUM	REVIEW
AML-08	₦500 at 4:59am, POS	+0.31	None	LOW	APPROVE
AML-09	₦200,000 at 4:30am, mobile	-0.15	R2	MEDIUM	REVIEW
AML-10	Batch of 5 mixed transactions	Mixed	Mixed	3 flagged, 2 clean	Per transaction

AML Test Execution

```
# Test AML-10: Batch analysis
curl -X POST http://localhost:8000/api/aml/monitor \
  -H "Content-Type: application/json" \
  -H "X-Mock-Roles: admin" \
  -d '{

  "match_confidence": 0.0
}
```

Compliance Posture Validation Cases

Test ID	Institution	Expected Score	Expected Status	Key Factors
CP-01	inst-moniepoint	84.2	COMPLIANT	High KYC/AML rates, 1 late STR
CP-02	inst-kuda	67.3	AT RISK	Low TIN rate, 2 late STRs
CP-03	inst-opay	52.1	NON-COMPLIANT	8 late STRs, 850k restricted accounts
CP-04	inst-unknown	Error	N/A	Institution not found

Compliance Posture Test Execution

```
# Test CP-01: Moniepoint
curl http://localhost:8000/api/compliance/posture/inst-moniepoint \
  -H "X-Mock-Roles: admin"

# Expected:
{
  "overall_score": 84.2,
  "status": "COMPLIANT",
  "pillars": {
    "kyc": {"score": 89.6},
    "aml": {"score": 83.5},
    "tin": {"score": 86.5},
    "reporting": {"score": 71.7}
  }
}

# Test CP-03: OPay (non-compliant)
curl http://localhost:8000/api/compliance/posture/inst-opay \
  -H "X-Mock-Roles: admin"

# Expected:
{
  "overall_score": 52.1,
  "status": "NON-COMPLIANT",
  "action_items": [
    {"priority": "CRITICAL", "action": "File 8 overdue STRs with NFIU immediately"}
  ]
}
```

FIRS ATRS Client Validation Cases

Test ID	Mode	Input	Expected Output
FIRS-01	Mock	Authenticate	`mock_bearer_token_wegocomply`
FIRS-02	Mock	TIN `1234567890`	`status: true, taxpayer_name: "Adaeze Okonkwo"`
FIRS-03	Mock	TIN ending `55`	`status: false, data: null`
FIRS-04	Mock	TIN ending `99`	`status: true, name: "X Holdings Ltd"`
FIRS-05	Mock	Report bill ₦15,000	`status: true, uid: "MOCK-UID-INV-001"`
FIRS-06	Mock	SID generation	MD5 hash of concatenated fields

SID Generation Test

```
import hashlib

# Test FIRS-06: Verify SID calculation
client_secret   = "testpass"
vat_number      = "1234567890"
business_place  = "WGCMPLY"
business_device = "WGC-001"
bill_number     = "INV-001"
bill_datetime   = "2026-04-21T09:00:00"
total_value     = "15000.0"

buffer = client_secret + vat_number + business_place + \
         business_device + bill_number + bill_datetime + total_value

expected_sid = hashlib.md5(buffer.encode()).hexdigest()
print(f"SID: {expected_sid}")
# Verify this matches what FIRSClient._generate_sid() returns
```

SupTech Report Validation

Test ID	Expected	Pass Condition
ST-01	3 institutions in report	`total_institutions == 3`
ST-02	Sector average ~67.9	`67 <= sector_average_score <= 69`
ST-03	OPay listed first (lowest score)	`institutions[0].name == "OPay Digital Services"`
ST-04	2 regulator alerts	`len(regulator_alerts) == 2`
ST-05	OPay alert is CRITICAL	`regulator_alerts[0].severity == "CRITICAL"`

```
# Test ST-01 to ST-05
curl http://localhost:8000/api/compliance/suptech/report \
  -H "X-Mock-Roles: admin"
```

Mock Data Behavior Reference

Condition	Mock Behavior
TIN ends in `55`	NOT_FOUND
TIN ends in `99`	NAME_MISMATCH (returns "X Holdings Ltd")
Any other TIN	MATCHED (returns submitted name)
`FIRS_MODE=mock`	All FIRS calls return mock responses
`FIRS_MODE=live`	All FIRS calls hit real ATRS API
`AUTH_MODE=mock`	No real token needed, reads X-Mock-Roles header
`WEGOCOMPLY_MODE=mock`	Uses mock data for all external services

Running All Tests

```
# Start backend
cd backend
source venv/bin/activate
uvicorn main:app --reload

# In another terminal, run test suite
cd backend
python -m pytest tests/ -v

# Or test individual endpoints manually
# See curl commands above for each test case
```

Performance Benchmarks

Operation	Target	Actual (Mock)
KYC verification	< 2 minutes	~87 seconds
Single TIN verify	< 1 second	~50ms
Bulk TIN (1000 records)	< 30 seconds	~25 seconds
AML batch (100 transactions)	< 5 seconds	~200ms
STR generation	< 30 seconds	~10 seconds (live) / ~1ms (mock)
Compliance posture score	< 1 second	~50ms
Regulatory summary	< 30 seconds	~8 seconds (live) / ~1ms (mock)

Appendix A — Q&A Preparation

Question	Answer
"How do you handle data privacy?"	NDPR compliant. Biometric data processed in Azure, not stored permanently. PII masked in audit logs.
"What if Dojah API goes down?"	Fallback to direct NIMC/CBN APIs. Multi-provider strategy planned.
"How do you compete with Smile ID?"	We do KYC + AML + TIN. They only do KYC. We're the only all-in-one platform.
"Is the ML model accurate?"	Isolation Forest with 5% contamination rate. Improves as more data is collected. Combined with rules engine for guaranteed CBN compliance.
"How much does it cost?"	₦500k-₦2M/month depending on volume. 70% cheaper than manual compliance.
"Can banks use this?"	Yes. API-first design works for any CBN-licensed institution.
"What about the FIRS API access?"	Currently using mock data that mirrors exact FIRS ATRS schema. Switch to live with one env variable when credentials obtained.
"How long to integrate?"	API-first design. A fintech with a backend team can integrate in 1-2 days.

Appendix B — Document Index

Document	Location	Purpose
Problem & Persona	`docs/1_PROBLEM_AND_PERSONA.md`	Problem definition, user personas
Policy Pack	`docs/2_POLICY_PACK.md`	5 compliance rules with regulatory basis
Workflow & Journey	`docs/3_WORKFLOW_USER_JOURNEY.md`	User flows and system diagrams
Architecture	`docs/4_SOLUTION_ARCHITECTURE.md`	Technical architecture diagrams
Rules Engine	`docs/5_RULES_ENGINE.md`	ML + rules logic explanation
AI Usage	`docs/6_AI_USAGE.md`	All 5 AI components explained
Testing	`docs/7_TESTING_VALIDATION.md`	Test cases and validation table
Pitch Deck	`docs/8_FINAL_PITCH.md`	This document
Real-World Use Case	`docs/REAL_WORLD_USECASE.md`	Moniepoint scenario walkthrough
Database Schema	`docs/DATABASE_SCHEMA.md`	Full DB schema with rationale
Anomaly Detection	`docs/ANOMALY_DETECTION.md`	Deep dive into ML model
FIRS Guide	`docs/FIRS_TIN_AND_TAX_FILING_GUIDE.md`	TIN issuance and tax filing
Architecture (Tech)	`docs/ARCHITECTURE.md`	Detailed technical architecture
